

Read-only access to our sales data

For: Oriel Infonet Solutions support | GSTIN 19AABCO1338F2ZM

We will only ever read. Nothing will be written, changed or deleted in Oriel, and we are not asking you to modify your software. If any of this affects our support terms, please tell us and we will take the option that does not.

Why we are asking

We are adding a staff-performance feature to our internal attendance app. Oriel records every sale correctly; the one thing it cannot tell us is **which shop assistant made each sale**, because the counter signs in as a shared till user (CASH1). We want to check what our staff record against the real bills, so the figures can be trusted.

There are three ways to give us this. **Any one is enough.** They are listed easiest-for-you first - please pick whichever you are most comfortable with.

Option 1 | A nightly emailed report (no database access at all)

Your software advertises *Email Integration, Schedule Auto Mailing, Vendor Data & Reports*. If the **Product-wise** sales report can email itself every night, that is all we need and the rest of this document can be ignored.

Send daily to: _____

One row per item per bill, with these columns:

Bill number	to group lines into one sale
Bill date AND time	to match against when staff recorded it
Location / shop code	we have two shops
Barcode	this is what our staff scan
Item description	for display
Quantity, rate, net amount	
Sale or return indicator	so a return is not counted as a sale
Cancelled / void flag	so a cancelled bill is not counted

CSV or Excel, either is fine. **If the time of the bill cannot be included, please say so** - it changes how we match, but is not fatal.

Option 2 | A read-only view (you keep control of the schema)

If you would rather not expose your tables, please create a **view** returning the columns above, and a second view for the item master (barcode, description, MRP / selling price, category or pattern). Then create an Oracle user with **SELECT on those two views only**.

This is our preferred option. You decide exactly what is visible, your internal schema stays private, and if you restructure later you only have to keep the views working.

Please send:

1. Host / IP and port of the database. Our POS server is 192.168.1.10 and the Oriel application runs on port 2021; we do not know the database port.
2. Service name or SID.
3. The read-only username and password.
4. The two view names.

Option 3 | Read-only access to the tables

If neither of the above is possible, please send the connection details above plus a read-only user, and run the four queries in the appendix and return the output. Those tell us where the sales data lives, so we read the right tables and nothing else.

Please answer these whichever option you choose

1. Which **Oracle version** are you running?
2. **Do our two shops share one database**, or does each have its own? If separate, do they replicate to a head-office copy?
3. **How does a cancelled bill appear** - is the row deleted, or flagged? Which column and value?
4. **How does a sales return appear** - negative quantity, a separate document type, or a flag?
5. **Is a barcode unique to one physical garment**, or shared by every piece of the same design and size? Our understanding is one code per piece - please confirm.
6. In the item grid, what does **"Pattern"** mean?
7. Is there a **documented API or web service** we should use instead of reading the database?

Two files, if you can

8. The **item master** exported to Excel - barcode, description, price, category.
9. **One ordinary day's item-wise sales** exported to Excel, showing each item on each bill. Any day. Customer names may be blanked out.

Appendix | Queries to run and return

These are **read-only catalogue queries**. They return the names and shapes of tables. They do not read customer or financial data and they change nothing. Run in SQL*Plus or SQL Developer and send the output as text.

A1 Version

```
select banner from v$version;
```

A2 Which schema holds the data

```
select owner, count(*) as tables
from all_tables
where owner not in ('SYS','SYSTEM','XDB','OUTLN','DBSNMP','APPQOSSYS',
                   'CTXSYS','MDSYS','ORDSYS','WM SYS','LBACSYS','OLAPSYS',
                   'ORDDATA','AUDSYS','OJVMSYS','DVSYS','GSMADMIN_INTERNAL',
                   'DBSFUSER','REMOTE_SCHEDULER_AGENT')

group by owner
order by 2 desc;
```

A3 The sales and item tables

Replace ORIEL with the owner name returned by A2.

```

select table_name, num_rows
from all_tables
where owner = 'ORIEL'
and ( upper(table_name) like '%SAL%'
      or upper(table_name) like '%BILL%'
      or upper(table_name) like '%INVOIC%'
      or upper(table_name) like '%POS%'
      or upper(table_name) like '%COUNTER%'
      or upper(table_name) like '%ITEM%'
      or upper(table_name) like '%BARCOD%'
      or upper(table_name) like '%PROD%'
      or upper(table_name) like '%STOCK%' )
order by table_name;

```

Our counter screen shows Program ID [COUNTERSALE], so a table or package with a similar name is probably the right starting point.

A4 The columns of those tables

Put the three or four names from A3 that hold the bill header, the bill lines and the item master into the list.

```

select table_name, column_id, column_name, data_type, data_length, nullable
from all_tab_columns
where owner = 'ORIEL'
and table_name in ('PUT_BILL_HEADER_HERE',
                   'PUT_BILL_LINES_HERE',
                   'PUT_ITEM_MASTER_HERE')
order by table_name, column_id;

```

A5 A few sample rows (optional, very helpful)

Five rows is plenty. Customer names, phone numbers and GSTINs may be blanked out - we do not need them.

```

select * from ORIEL.PUT_BILL_LINES_HERE where rownum <= 5;

```

Please reply to _____. We are happy to sign whatever you need regarding not writing to the database.
